. Posted by Grubby on August 9th, 2015 Universe Creator QUICK NOTE: These are early in development, please be patient. Planet hopping in a black hole. This is a challenge to create an art style that lends itself to a 2d game with 3d elements such as items. It is also a challenge to create an art style that is modular enough to grow and change with the game. The first pass (while very basic, nothing is too far out there for now) is a planet that orbits a black hole. The game will be set in an alternate future where black holes are common and planets orbit a larger black hole that acts as a nexus. The game is a hard sci fi space opera with space pirates, greed, and politics. The aliens are the size of a baseball, and everyone else is human. I expect to have this up on the site by end of summer. Again, I'd love to get feedback. btw, any feedback is really appreciated. The quick shot I posted is from a level that I had quickly hacked together. The game is a lot bigger than that. So please be patient. Lastly, I know this is a odd format, but I will also have time to work on the art and the music, so that will be a separate thing once I get enough art done to create a playable prototype. Downloads I got a couple shots of the planet below. Hope you enjoy! Molecular characterization of low-copy-number type 4 fimbriae of *Escherichia coli*. Fimbrial structures are filamentous surface appendages that facilitate cell-to-cell adhesion in bacteria. In this study, the fimbrial structures of *Escherichia coli* B215/1 (serotype O6:K5) and the intimin (*Escherichia coli* B230/1) from a meningitic *E. coli* strain were characterized. In addition to the previously reported pilus, a novel fimbrial structure was identified in which polypeptides with Mr of approximately 5 and 25 kDa were covalently linked to the bacterial surface. This structure was termed low-copy-number type 4 fimbriae (LCN-4). The 5-kDa protein of LCN-4 is related in sequence 82157476af
